### APPLICATION AND USE

Multiprotocol I/O modules of the MINI-IP series are compact devices working as remote I/Os over IP with open protocols, BACnet IP and Modbus TCP/IP. The MINI-IP modules can extend building controllers with a number of inputs and outputs and complement the MIX I/O modules. Unlike the MIX series, the MINI line is dedicated to all applications where manually operated switches are required. Built-in algorithms for lighting, cooling, and heating make them suitable for use as standalone controllers. In addition, the modules support timer relay modes dedicated to occupancy sensors. Like the MIX-IP series, the MINI-IP modules are factory-equipped with the two most popular open communication protocols, Modbus TCP/IP and BACnet IP, selected using DIP switches. The MINI-IP series modules are equipped with the Ethernet and RS485 interfaces. They have an additional functionality, the Modbus TCP/IP to Modbus RTU/ASCII gateway, enabling the connection of additional modules/devices, which communicate as servers (slaves) on the serial bus. The Modbus gateway functionality is active both when the module is operating in the Modbus and BACnet mode. The MINI-IP modules, communicating either in Modbus or BACnet, are always client (master) units on the network. One major advantage of supporting the modules with open communication standards is the versatility to install them in both new and completed installations, as part of an existing BMS. The modules are addressed using rotary switches, which facilitates and accelerates the process of commissioning the system. Built-in mini USB allows for the initial configuration of the unit without a power supply.
